

Lab 3

Used in this TP:

`$_POST`, `fopen ()`, `fwrite ()`, `fgets ()`, `fclose ()`, `isset ()`, `$_SERVER['PHP_SELF']`

Problem I Sarahah.com

sarahah website in its lightweight version.

First, create the **index.php** file which contains the html form.

Science Dep.

Read messages

Make your message fruitful!

Science Dep.

Send a message

Username:

Password:

Very good job!

Keep working guys...

Hello all happy to be here !

Insert the message into the **messages.txt** file , each line contains a message. The PHP code must be in the same **index.php** file . To insert a new message, open the **message.txt** file and add the message to the end of the file.

In another file named **see.php** , we need to retrieve the data with `$_POST` and display all the messages one by one.

To read the messages, open the **messages.txt** file and read line by line.

Problem II Secured access

Add a **username / password form** to access messages.

Problem III Redirection

Redirect the client to **index.php** if they enter an incorrect username or password.

Problem III PHP_SELF

Use **PHP_SELF** in the form.
