

## Lab 4

### Used in this TP:

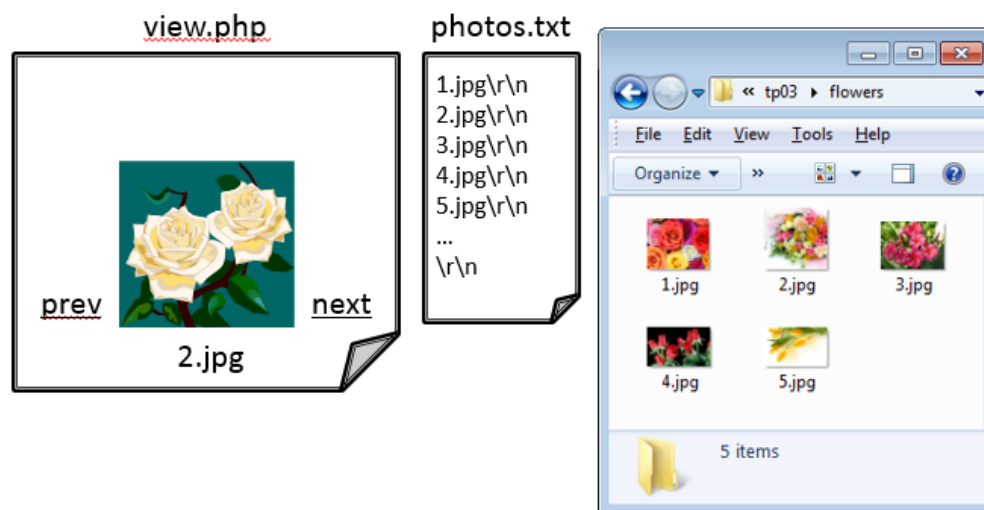

`$_GET`, `$_POST`, `fopen()`, `fwrite()`, `fgets()`, `fclose()`, `isset()`, `$_SERVER['PHP_SELF']`, `$_FILES`

### Problem I Online public photo album

The goal is to build a photo album in this lightweight version.

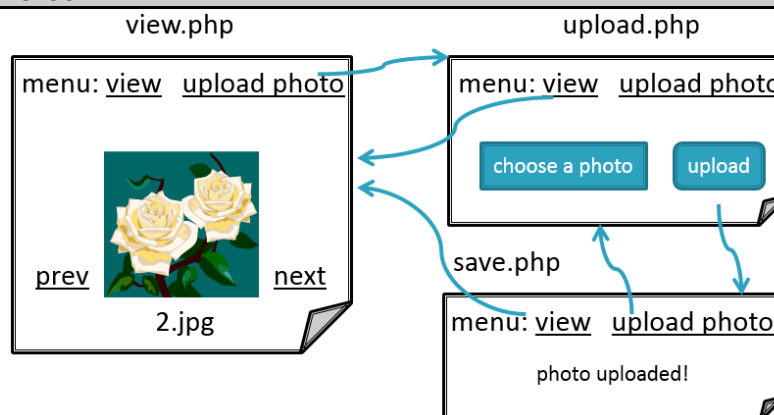

First, create the file **photos.txt** which contains the list of photos that exist in the **flowers** directory .

**view.php** code that displays the photos using two links "**prev**" and "**next**". This file reads the photos from the text file **photos.txt** .

To read the photos, open the **photos.txt** file and read line by line.

### Problem II Add photos

Write the **upload.php** file which allows you to upload new photos to the **flowers** folder on the server.

The selected photo is processed with the **save.php** code .
